

Call for crowdsourced analysis: Many Analysts Religion Project (MARP)

What is the idea? We invite researchers to answer two theoretically relevant research questions by analyzing a recently collected dataset on religion and well-being ($N=10,535$ from 24 countries).

Who can participate? Researchers at all levels are welcome (PhD student to full professor); you can sign up individually or as a team. Extensive methodological or topical knowledge is not a prerequisite.

What are the research questions? 1) Do religious people report higher well-being? 2) Does the relation between religiosity and well-being depend on how important people consider religion to be in their country (i.e., perceived cultural norms of religion)?

What do we offer? Co-authorship for the entire analysis team on the paper.

What do we want from you? We ask you to propose and conduct an analysis to answer the two research questions, following a 2-stage process. In the first stage you receive all study information and propose an analysis. In the second stage, you execute the proposed analysis and complete a short survey summarising your results.

What do we provide? To make the experience as comfortable as possible, we will provide a clean dataset + documentation. Specifically, we will share the original questionnaire, a data documentation file, some short theoretical background (stage 1) and the preprocessed data (reverse-scaled etc.; stage 2). You can already access the project information here:

<http://bit.ly/MARPinfo>

When do we need you? You can sign up right away <http://bit.ly/MARPsigup>. The first stage (proposal) will run until December 22nd, 2020 and the second stage (execution) until February 28th, 2021.
